## 4 Theoretical Background

### 4.1 Radio Frequency Identification

### 4.2 Trilateration<sup>1</sup>

Trilateration is a method to compute the intersecting point of three circles/spheres. For this, it is necessary to know the three center of the circles/spheres plus their corresponding radii. The basic idea is to use the description of sphere.

$$r^2 = (x - x_1)^2 + (y - y_1)^2 + (z - z_1)^2 \quad (1)$$

where  $(P_n = (x_n, y_n, z_n))$  is the center of the sphere. To use equation 4.2 for the 2D indoor localization on a floor, a few assumption can be made. First of all, the z-component of all spheres can be neglected. Another assumption is that we define the origin of the first circle as the center of the coordinate system, the second along the x-axis with an distance (d) and the third shifted in x- (i) and y-direction (j).

Figure 1: Overview Trilateration

With known positions of the center of the circles d, i and j can be computed in the following

<sup>1</sup>Indoor Robot Positioning using an Enhanced Trilateration Algorithm

way:

$$d = |P_2 - P_1| \quad (2)$$

$$e_x = \frac{1}{d}(P_2 - P_1) \quad (3)$$

$$a_x = P_3 - P_1 \quad (4)$$

$$i = e_x \cdot a_x \quad (5)$$

$$a_y = (P_3 - P_1) - i * e_x \quad (6)$$

$$e_y = \frac{a_y}{|a_y|} \quad (7)$$

$$j = e_y \cdot a_x \quad (8)$$

After knowing the these values, the relative distance in x- and y-direction can be computed with the help of 4.2 and the center of the circles  $P_1(0,0)$ ,  $P_2(0,d)$  and  $P_3(i,j)$  as follows:

$$x_t = \frac{r_1^2 - r_2^2 + d^2}{2 * d} \quad (9)$$

$$y_t = \frac{r_1^2 - r_3^2 + i^2 + j^2}{2 * j} - i * \left( \frac{x_t}{j} \right) \quad (10)$$

The absolute position of the intersection point is computed in following way:

$$P = P_1 + e_x * x_t + e_y * y_t \quad (11)$$
